DETAILED ACTION

Response to Amendment

1. Applicant's amendments in response to office action dated 2/5/08 have been noted and accepted.

Allowable Subject Matter

2. Claims 1-32 are allowed.
3. The following is a statement for the identification of allowable subject matter.

Concerning claims 1-32, the prior art fails to teach receiving in a mobile wireless communication terminal one or more instructions to respectively perform one or more tasks concerning data file transfer over an air interface that can be executed in said terminal with a delay, storing said instructions in said terminal, checking in said terminal whether said terminal is coupled to a charging device, calculating with a high likelihood that the terminal is connected to the charger, and executing in said terminal said data file transfer tasks over said air interface upon recognizing an electrical connection between said terminal and said charging device, thereby allowing deferring of execution unless the terminal is connected to the charger.

Averbuch et al. (5689825) is an exemplary reference from a relevant subclass. Averbuch is discussing a portable wireless communication unit that is coupled to a battery charger/software downloader via a unit interface. After detecting a flag in the portable wireless communication unit, the software downloader that includes a processing unit and a memory, receives updated

Art Unit: 2617

software from a server and downloads the updated software to the portable wireless communication unit via the unit interface.

Nishiyama et al. is also an exemplary reference from a relevant subclass. Nishiyama is discussing a portable radio telephone system that includes a small and light radio telephone device and a charger for charging a storage battery in the radio telephone device. The charger has a connector for connection to a data communication device. A data signal received by a radio circuit and converted by a baseband circuit in the radio telephone device is supplied to a data interface, which superposes the data signal on charging electric energy. The data signal is then supplied through charging terminals of the radio telephone device and charging terminals of the charger. In the charger, the data signal is converted by a data interface into a signal for transmission through the connector to the data communication device.

Herrod et Al. is an exemplary reference from a relevant subclass. Herrod is discussing a portable data device system that includes a portable data device and a cradle for receiving the portable data device. The cradle is arranged to recharge the portable data device power supply and/or upload or download information to and from the portable data device. The cradle and portable data device are in wireless communication allowing a minimum of processing and data storage capability at the front end and allow operation of the portable data device as a thin client.

Therefore, with regards to claims 1-32, the prior art fails to teach receiving in a mobile wireless communication terminal one or more instructions to respectively perform one or more tasks concerning data file transfer over an air interface that can be executed in said terminal with a delay, storing said instructions in said terminal, checking in said terminal whether said

Art Unit: 2617

terminal is coupled to a charging device, and executing in said terminal said data file transfer tasks over said air interface upon recognizing an electrical connection between said terminal and said charging device. In particular, prior art does not teach a delaying of tasks controlled by a mobile terminal.
